At a glance

Company: PMC Treasury

Technology: WordPress, PHP, AWS Elastic Beanstalk, version control and a deployment pipeline

The problem

PMC Treasury wanted its main website to drive more sign-ups to pmcanalytics.com, but the site was hard to change. It ran on WordPress, managed by an outside consultant who held the only access to the code and database. There was no staging site and no reliable backups, so every change went straight to live.

What I did

- Proposed moving the site into PMC Analytics' AWS environment and got sign-off from the CEO.
- Worked with the consultant to hand over the code, database, credentials and settings smoothly and on good terms.

- Built the hosting on AWS: database, Elastic Beanstalk, version control and a deployment pipeline.
- Upgraded WordPress, PHP and the plugins, and tightened security.
- Migrated the code and database, and set up regular backups and a separate staging site.

The result

The migration went live without issues. PMC Treasury now owns its code and data, can make changes itself, and has a safer, up-to-date site with backups and staging.
